 i. In a processor register

 iii. On a stack
 Which of these possibilities supports subroutine nesting and which supports subroutine recursion (that is, a subroutine that calls itself)?

 (b) Explain the series of actions that a DMA controller will perform after it receives a request from a peripheral device to transfer data from the peripheral device to memory. (5) 4 2
- 14 (a) The purpose of using an L2 cache is to reduce the miss penalty of the L1 cache, and in turn to reduce the memory access time as seen by the processor. An alternative is to increase the size of the L1 cache to increase its hit rate. What limits the utility of this approach? Give proper justifications for your answer. (4) 5 3
 (b) Suppose that a computer has a processor with two L1 caches, one for instructions and one for data, and an L2 cache. Let τ be the access time for the two L1 caches. The miss penalties are approximately 15τ for transferring a block from L2 to L1, and 100τ for transferring a block

from the main memory to L2. For the purpose of this problem, assume that the hit rates are the same for instructions and data and that the hit rates in the L1 and L2 caches are 0.96 and 0.80, respectively.

- i. What fraction of accesses miss in both the L1 and L2 caches, thus requiring access to the main memory?
- ii. Suppose that the L2 cache has an ideal hit rate of 1. By what factor would this reduce the average memory access time as seen by the processor?

(OR)
